6 March 2015

## **CLUNES DRILLING - INFORMATION.**

Clunes drill hole CD15-02 is a recently drilled (incomplete) hole which was stopped at 153.6 metres down-hole.

The attitude of this hole is near-vertical, at depressed angle about 80 degrees, azimuth 282M.

On 6 February, 2015, this hole CD15-02 drilled through the interval 132 to 153.6 metres, being suspended having intersected the upper part of the geological structure of interest, as was projected from previous work in year 2006, supported by observations of core from hole CD15-01.

Assays for hole CD15-02 have come to hand late today. Assays for hole CD15-01 were reported to the Company some days ago. Neither sets of assays have been reported to NSX.

The Directors are obliged to report assays having regard to market requirements. These will take time to prepare on this occasion.

No hole within MIN 5391 is further south-east than CD15-02. A zone of significant interest (by assay) is to be reported to NSX from that hole. The intercept position of hole CD15-02 is 35 metres within the private land as measured from the eastern fence, and 45 metres north of the southern fence.

No drilling by any previous explorer holding tenure over Clunes tested this location, or the on-going projection of the structure to the south. Northern intercepts of this structure were reported to NSX in years 2006 and 2007 - some 40 metres north.

Directors are well aware that the results of these holes are likely to dictate all future work at Clunes, especially in this vicinity.

The above-mentioned assays will be reported to NSX in proper context, probably after market close next Thursday, March 12, 2015.

The sampling of hole CD15-03 has been completed, with samples delivered for assay today. No sampling of hole CD15-04 has been undertaken as yet.

Meantime, this round of drilling is to conclude on completion of hole CD15-06, possibly on Wednesday next.

F.L.Hunt,  
On behalf of Directors, Mount Rommel Mining Ltd.
