24 July 2015

GLENFINE, MIN 5492

Mount Rommel Mining Ltd shareholders are aware from previous announcements that work to unlock new gold from the Glenfine site has been on going.

Mount Rommel Mining Ltd are able to advise that during June of 2015 the first pre-commercial commissioning trials were completed.

This work comprised the processing of some 80 tonnes of tailing material in multiple parcels for the express purpose of examining:

- full scale load rate for the raw tailings
- tailings dispersion during agitation
- impact of large particulate separation & study of high SG components
- Carbon In Pulp behaviour under load

This work has shown a comprehensive correlation between metallurgical laboratory studies and the functionality of the plant design to process these tailings.

The Glenfine plant has been progressively built as knowledge about the bulk behaviour of these tailings has grown.

The pre-commissioning trial has shown that the Metallurgical Flow Sheet developed is both efficient and effective for these tailings.

The next steps consist of further plant upgrades to accelerate performance and remove the need for intervention during operation. Once this work is complete and tested work will commence on retro fitting of the second process set.

It is expected that further processing will commence shortly after the current works are completed - late August / early September.

Members of the Company may specifically acknowledge the efforts of a very small group to assist in creating this highly innovative process plant.

Hamish Hunt,
Director.
